include evidence and explain to this point to make it an effective argument for primary 7: Plastic is a major contributor to environmental pollution and poses a threat to wildlife and marine life.

Plastic pollution is a significant environmental issue that has been affecting our planet for decades. According to a report by the United Nations, over 8 million tons of plastic waste end up in the oceans every year, causing harm to marine life and ecosystems. Plastic pollution is also a threat to wildlife, as animals can mistake plastic for food or become entangled in plastic debris, leading to injury or death.

There are numerous examples of the harmful effects of plastic pollution on wildlife and marine life. For instance, sea turtles often mistake plastic bags for jellyfish and ingest them, leading to blockages in their digestive systems. Similarly, seabirds can become entangled in plastic debris, which can cause them to drown or starve to death. Plastic pollution also affects marine ecosystems, as it can disrupt the food chain and harm the health of marine organisms.

Furthermore, plastic pollution has a significant impact on human health. Plastic waste can release harmful chemicals into the environment, which can contaminate soil and water sources. These chemicals can then enter the food chain, posing a risk to human health.

In conclusion, plastic pollution is a major contributor to environmental pollution and poses a threat to wildlife and marine life. It is essential that we take action to reduce our use of plastic and properly dispose of plastic waste to protect our planet and its inhabitants.
